Senior Software Engineer

Aug 2022 - Present

Bloomberg *- New York City / Princeton, NJ*

Built large-scale automation frameworks, CICD pipeline, observability systems, and LLM-powered intelligent tooling used across 60+ engineering teams in Bloomberg's Buyside (Asset & Investment mgmt) platform. Drove adoption of next-generation testing, triage, and environment provisioning tools across the org through technical leadership, demos, documentation, and cross-team strategy alignment.

Centralized Automation Frameworks — UI + Backend

- Helped build and maintain AIM's centralized automation frameworks for both front-end (Terminal UI) and back-end service testing.
- DevOps with Jenkins Pipeline feeding to Kafka Queues for Test Observability, Monitoring and Alarming
- Created shared step repositories used by 60+ engineering teams, enabling consistent, scalable BDD automation across AIM.

LIGO — Test Observability Platform

- Contributed to full-stack development of Bloomberg's enterprise test-observability tool.
- Built frontend components using React, Next.js, Redux; developed Python middleware; implemented backend integrations with Bloomberg's proprietary database system
- Enabled engineers across AIM/TOMS to visualize execution history, logs, metrics, flaky trends, and system-level test behavior.

ONCL Buddy — LLM-Powered Failure Analysis for On-Call Triage

- Built a retrieval-augmented system that queries LIGO historical test results + fetches logs of the current run.
- Delivered intelligent failure classification and root-cause assessment to ONCL engineers to reduce triage time.
- Uses RAG, embeddings, prompt engineering, and multi-agent evaluation.

Text2BDD — Agentic Test Case Generator + BDD Search

- Architected an end-to-end agentic application for test writing and healing of BDD repositories (Behave, Cucumber).
- Embedded all steps, scenarios, and examples into vector databases to enable semantic search for step/scenario discovery.
- Built scenario-generation agents that synthesize new BDD test cases using repository embeddings + RAG pipelines
- Empowered 60+ teams to expand automation coverage without manually writing new steps.

PXC — Environment Provisioning System

- Developed components of Bloomberg's environment provisioning system used to mimic production-like application-service environments for testing and deployment simulations.
- Automated provisioning flows and integrated with internal infra services to reduce manual build/setup cycles.

Education

University Of Rhode Island | GPA: 3.6

Code:
Python, Typescript, Java

Generative AI models, Tools, APIs:
OpenAI, DeepSeek, Claude, Gemini, Ollama, Copilot, Cursor, Claude Code

MCP & RAG Pipelines:
MCP Servers, Embeddings, context engineering with SQL DBs and Cloud Storage, retrieval pipelines using vector DBs and semantic search, agent short \long term memory and caching

Frameworks:
Langchain, Langraph, OpenAI SDK, CrewAI, Huggingface Libraries, numpy, pandas, pytorch

Vector Databases:
FAISS, Chroma, Solr

Test Automation:
Front\Bacfkend testing FWs, Devops, Monitoring, Observability and Alarming, LLM Evaluation testing and Optimization

Web Technologies
React, nextJs, Redux

araiz.baqi@gmail.com

Senior Software Engineer Aug 2022 - Present

Bloomberg *- New York City / Princeton, NJ*

Responsibilities & Leadership

- Lead development across frontend, backend, automation, and AI tooling.
- Architected solutions spanning observability, CI/CD pipelines, test reliability, and developer productivity.
- Presented major tools (LIGO, ONCL Assistant, Text2BDD) across AIM, TOMS, and RIST to drive org-wide adoption.
- Wrote technical specifications, test strategies, automation roadmaps, and design docs.
- Partnered with QA leads, PMs, and senior architects to shape testing strategy across the product.

Software Developer in Test Oct 2017 - Aug 2022

Dell - Austin, TX

- Built a patented log analysis tool for test failure remediation, leveraging embeddings of past test failures + KNN Search
- Automated functional test cases with Python, Java, JavaScript, and CLI tools.
- Implemented Selenium-based GUI testing framework + Appium mobile testing suite for Android.
- Created Python-based dashboards using Pandas, NumPy, Matplotlib, and Plotly to visualize test results and defect trends.
- Worked across full Agile cycle: requirements → test strategy → automation → demo → signoff.
- Translated business requirements into test scenarios and automated test collateral in parallel to feature development
- Materializing a simulation based framework using Appium for Android Mobile testing.
